Foreword

v Forecasts Made

Most of the annual streamflow in the Western United States originates as snowfall. This snowfall accumulates high in the mountains during winter and early spring. As the snowpack accumulates, hydrologists estimate the runoff that will occur when it melts. Predictions are based on careful measurements of snow water equivalent at selected index points. Precipitation, temperature, soil moisture and antecedent streamflow data are viewed in conjunction with snowpack data to prepare runoff forecasts. This report presents a comprehensive picture of water supply outlook conditions for areas dependent upon surface runoff. It includes selected streamflow forecasts, summarized snowpack and precipitation data, reservoir storage data and narratives describing current conditions.

Streamflow forecasts are cooperatively generated by Soil Conservation Service and National Weather Service hydrologists. Forecasts become more accurate as more data affecting runoff becomes known. For this reason, forecasts are issued that reflect three future precipitation conditions — Below Normal, Average, and Above Normal. These forecasts are termed reasonable minimum, most probable, and reasonable maximum. Actual streamflow can be expected to fall between the lower and upper forecast values eight out of ten years.

Snowpack data are obtained by using a combination of manual and automated measurement methods. Manual readings of snow depth and water equivalent are taken at locations called snow courses on a monthly or semi-monthly schedule during the winter. In addition, snow water equivalent, precipitation, temperature, and other parameters are monitored on a daily basis and transmitted via radio telemetry to central data collection facilities. Both monthly and daily data are used to project snowmelt runoff.

ır More Information

Copies of Monthly Water Supply Outlook Reports and other reports may be obtained from the states listed below. Because of the limited space, snow survey measurements are not published in monthly reports. An annual snow survey data summary is published by the Soil Conservation Service for each of the western states. Historical snow survey data may be obtained at those same offices.

STATE	ADDRESS
Alaska	201 East 9th Ave., Suite 300, Anchorage, AK 99501-3687
Arizona	201 East Indianola, Suite 200, Phoenix, AZ 85012
Colorado (New Mexico)	2490 West 26th Ave., Denver, CO 80211
Idaho	304 North 8th Street, Room 345, Boise, ID 83702
Montana	10 East Babcock, Room 443, Federal Building, Bozeman, MT 59715

STREAMFLOW PROSPECTS
NEVADA

APRIL 1985 4-R-39131

GENERAL OUTLOOK

MMARY:

WATER SUPPLIES STATEWIDE WILL BE GOOD TO EXCELLENT FOR 1986. BASIN SNOWPACK ACCUMULATIONS RANGE FROM 100 TO 160 PERCENT OF AVERAGE. WATER YEAR PRECIPITATION IS ABOVE AVERAGE WITH THE SINGLE EXCEPTION OF SOUTHERN NEVADA. RESERVOIR STORAGE IS EXCELLENT AND SHOULD PROVIDE ADEQUATE WATER FOR ALL USES THIS SUMMER. STREAMFLOW FORECAST VALUES RANGE FROM NEAR AVERAGE TO MUCH ABOVE AVERAGE STATEWIDE. . .

OWPACK:

Snowpack accumulations in the seven major basins in the state are all near or above average for April 1. Carson-Walker basin has the highest snowpack total at 160 percent of average. Southern, Northern Great, Humboldt, and Snake- Owyhee basins are all near average. Tahoe-Truckee basin is 135 percent of average while the Eastern basin is 140% of average. Lower elevation snow course readings in northern and eastern Nevada are below twenty year averages, but the higher elevation readings are sufficiently above average to result in an overall above average basin snowpack total. Snow received in the Sierra during the large February storm has been retained even though above average temperatures were recorded during March. .

ECIPITATION:

March basin-wide precipitation was below average in Humboldt, South, and Snake-Owyhee basins and above average in Tahoe-Truckee, Carson-Walker, Eastern, and Northern Great basins. March basin-wide precipitation ranged from 60 to 150 percent of average. Water year precipitation is above average in all basins with the exception of southern Nevada which is 20 percent below average. All other basins' water-year precipitation range from 120 to 130 percent of average. .

RESERVOIRS:

Reservoir storage on April 1 was excellent throughout Nevada. Stored water ranged from 100 to 200 percent of average. All reservoirs, with the exception of Bridgeport Reservoir, contain more stored water this year than last. Basin total storage for Tahoe-Truckee, Carson-Walker, Humboldt, and Snake-Owyhee basins was above average. Stored water in the seven major reservoirs (Boca, Lake Tahoe, Bridgeport, Lahontan, Topaz, Rye Patch, and Wildhorse) was 145 percent of average. .

STREAMFLOW:

Streamflow prospects are excellent for 1986. Forecast values range from 85 to 170 percent of average. Tahoe-Truckee basin forecast values are 120 to 160 percent of average. Carson- Walker basin streamflow will be even greater with total flow for the forecast period ranging from 150 to 170 percent of average. Below average streamflow can be expected near McDermitt, Nevada, where forecast values are approximately 90 percent of average. The only other below average forecast is for Reese River near Ione, Nevada. The forecast value for this gaging station is 90 percent of average. .

WATER SUPPLY OUTLOOK:

Water supply for the Tahoe-Truckee basin will be excellent this year. Basin snowpack accumulation is 135 percent of average for April 1. Basin wide reservoir storage is 160 percent of average, and Lake Tahoe is approximately 90 percent of capacity. All streamflow forecasts are above average. Truckee River at Farad, California, will flow 395,000 acre feet between April 1 and July 31 , which is 150 percent of average. The forecasted total rise for Pyramid Lake is 8.5 feet.

For more information contact your local Soil Conservation Service office.

WATER SUPPLY OUTLOOK:

Water supplies will be good this summer with snowpack accumulations at 140 percent of average. Water content values at snow courses below 7500 feet elevation are near or slighlty below average while higher elevation courses are reporting values well above average. Streamflow forecasts are all above average for the April through July period. Steptoe Creek near Ely, Nevada, is forecasted at 2900 acre feet or 145 percent of average while Kingston Creek near Austin, Nevada, will flow 3800 acre feet.

For more information contact your local Soil Conservation Service office.

Monthly precipitation ▮ Year to date precipitation ▮

WATER SUPPLY OUTLOOK:

Snowpack accumulations in southern Nevada are average for April 1. Water supplies will vary throughout the basin. Runoff in the Spring Mountains west of Las Vegas should be average while water levels in Mohave and Mead will be excellent. Streamflow in the Virgin River will be below average for the April through July period. March precipitation was 60 percent of average and contributes to a water-year total only 80 percent of average.
